## 1.1 Generator / output section - current outputs

**Note:** For detailed information refer to the section “Technical Data” in the CPC 100 Reference Manual available in pdf format on the *CPC 100 Toolsets* or the *CPC 100 Start Page*.

The output is either voltage or current, and is automatically selected by the software or manually by the user. Current and voltage outputs are overload and short-circuit proof and protected against over-temperature.

## 1.5 Notes related to inputs and outputs

All input/output values are guaranteed over one year within an ambient temperature of  $23^{\circ}\text{C} \pm 5^{\circ}$  ( $73^{\circ}\text{F} \pm 10^{\circ}\text{F}$ ), a warm-up time longer than 25 min and in a frequency range of 45 ... 60 Hz or DC. Accuracy values indicate that the error is smaller than  $\pm$  (value read  $\times$  reading error + full scale of the range  $\times$  full scale error).

1. With a mains voltage of 230 V using a 2 x 6 m high-current cable at an ambient temperature of  $23^{\circ}\text{C} \pm 5^{\circ}$  ( $73^{\circ}\text{F} \pm 10^{\circ}\text{F}$ )
2. Signals below 50 Hz or above 60 Hz with reduced values possible.
3. Output can be synchronized with V1 AC in **Quick**, **Sequencer**, **Ramping** and **Amplifier**.
4. The input / output is protected with lightning arrestors between the connector and against protective earth. In case of energy above a few hundred Joule the lightning arrestors apply a permanent short-circuit to the input / output.
5. Signals below 50 Hz or above 200 Hz with reduced values possible.
6. 98 % of all units have an accuracy better than specified as *typical*.
7. Input is galvanically separated from all other inputs
8. V1 and V2 are galvanically coupled but separated from all other inputs.
9. There are power restrictions for mains voltages below 190V AC.
10. Fuse-protected
11. When using the **CTRogowski** test card, the 3V **V2 AC** input uses an additional software based integration method. In the range of  $50\text{ Hz} < f < 60\text{ Hz}$ , this results in a phase shift of  $90^{\circ}$  as well as an additional phase error of  $+\/- 0.1^{\circ}$  and an additional amplitude error of  $+\/- 0.01\%$ . For frequencies in the range of  $15\text{ Hz} < f < 400\text{ Hz}$ , the phase error is not specified, and the amplitude error can be up to  $+\/- 0.50\%$  higher.
